TITLE: The stressed state about a circular opening in an orthotropic cylindrical shell

SOURCE: Prikladnaya mekhanika, v. 2, no. 7, 1966, 22-26

TOPIC TAGS: stress distribution, stress analysis, anisotropic medium, orthotropic shell

ABSTRACT: The effects of the anisotropy of a material upon the stress concentration around an opening are discussed in the case of thin shells. The variation of the stressed state about a circular opening was considered as a function of the orthotropy of the material of a cylindrical shell in a reference system of polar semigeodetic coordinates. Using the generalized Bubnov-Galerkin method, the entire problem was reduced to the solution of a system of five differential equations with appropriate boundary conditions. An M-20 computer was used for the calculations. It appears that the overall stress concentration is primarily a function of the bending stresses, and that the bending components, which account for the major portion of the bending stress, depend largely on the orthotropy of the material. The obtained relations between the

Card 1/2

L 46136-66

ACC NR: AP6026792

absolute maximum concentration coefficients and the orthotropy of the material can be used for the stipulation of optimum relations between the elasticity moduli. These optimum relations, in turn, provide the basis for the calculation of minimum stress concentrations in the design of thin-walled cylindrical shells. Orig. art. has: 4 figures, 8 formulas.

Tumor Growth.

Orig Pub : Vrachobn. delo, 1957, No 4, 429-430.

Abstract : The effect of 5 species of Protozoa on Kroker's mouse sarcoma was studied. The ability to inhibit tumor development was found in Trypanosoma cruzi, Leishmania donovani and Trypon-
osoma equiperdum, i.e. those Protozoa which cause a generalized disease and death in mice. T. cruzi were found in the spleen, liver and, in 56% of the animals, in tumors. No relationship was found between the presence or absence of parasites and the inhibition of growth of sarcoma. L. donovani and T. equiperdum were found in internal organs of the animals but were absent from tumors. L. tropica on T. lewisi failed to

VII over Pd gives a mixture of stereoisomeric cyclohexane-1,2,4-tricarboxylic acids (VIII) (yield 450 mg, mp 210-212° (from water)); the known cis-VIII (300 mg, mp 224-225°) was obtained by fractional crystallization of the stereoisomeric mixture from dil CH₃COOH. When the trimethyl ester of cis-VII is refluxed with a solution of CH₃COONa in abs CH₃OH (1 hr), followed by dilution with water, acidification, and further refluxing (30 min), transVIII is obtained (mp 220-222° from dil CH₃COOH). The hydrogenation of 10.4 gms VI over a Pd catalyst, followed by extraction with ether and chromatographic analysis of the ether extract on Al₂O₃ gives 8.8 gms of the diethyl ester of 2-cyano cyclohexane-1,4-dicarboxylic acid (IX) (elution with C₆H₆, bp 132-134°/0.02 mm, n²⁰D 1.4629, d²⁰₄ 1.0975) and 100 mg of an unidentified

aldehyde ether (an oily liquid; elution with a mixture of C_6H_6 and alcohol). The residue left after the ether extraction on alkalization yields 2,5-dicarbethoxycyclohexylmethylamine (yield 1 gm); 2,5-dicarbethoxycyclohexylmethylamine (yield 1 gm); 2,5-dicarbethoxycyclohexylmethylamine (yield 1 gm); benzoyl derivative, yield 1.1 gm, mp 87-88° (from benzene). The acid hydrolysis of IX gives VIII. A mixture of 19.8 gms I, 7 gms III, 40 ml xylene, and 0.5 gm V on heating for 20 hrs at 155-160° gives the diethyl ester of 2-formyl-5-cyclohexene-1,4-dicarboxylic acid (X), yield 52%, bp 82-84°/0.001 mm, 98-100°/0.01 mm, n_{D}^{20} 1.4814, d_{4}^{20} 1.1436; 2,4-dinitrophenylhydrazone (DWH) mp 104.5-105.5° (from ligroin). The oxidation of X (by refluxing with an aqueous suspension of Ag_2O) leads to the formation of VII, while

Card : 4/14

"The Influence of Drugs on Krebs' Tricarboxylic Cycle."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 5, Sep 66, p 419

Abstract: Glutamate -2-C¹⁴ metabolized in Krebs' cycle can yield lactate tagged in two ways. Lactate containing C¹⁴ in the carboxylic group can be formed only via succinate, oxalacetate, and pyruvate, that is by the normal Krebs' cycle; glutamate metabolized via citrate, oxalacetate, and pyruvate produces a lactate tagged on C 2 and 3. Experiments with rats to which catecholamines were administered showed that only 1/3 of the lactate was produced through the Krebs' cycle, while 2/3 were produced via the other path. The influence of various doses of catecholamines on the proportions of glutamate metabolized through the two different paths is discussed. The influence of insulin is described. No references. Submitted at 14 Days of Pharmacology at Smolenice, 17 Feb 66.

TITLE: Properties of the focusing of atomic collisions in cathode atomization of tungsten and molybdenum monocrystals

SOURCE: Fizika tverdogo tela, v. 7, no. 6, 1965, 1623-1629

TOPIC TAGS: single crystal, tungsten, molybdenum, angular distribution, atomization

ABSTRACT: Energy and angular distributions of the flux of scattered atoms issuing from tungsten and molybdenum monocrystals were studied by means of mercury ions. It was shown that slower particles are better focused in the <111> direction and faster particles focus better in the <100> direction. As the energy of primary ions increases, the flux of particles in the <100> direction increases in comparison with the flux of particles in the <111> direction. The authors express gratitude to O. D. Protopopov for placing monocrystal samples at their disposal. Orig. art. has: 5 figures and 2 formulas.

TITLE: Special features of focusing of atomic collisions in the case of cathode sputtering of single crystals of tungsten and molybdenum

SOURCE: Fizika tverdogo tela, v. 7, no. 6, 1965, 1623-1629

TOPIC TAGS: tungsten, molybdenum, ion bombardment, atomization

ABSTRACT: The authors have compared the fluxes of sputtered atoms emitted along different crystallographic directions, and measured the energy distribution in each direction, for the purpose of determining the special features of focusing of atomic collisions in body-centered crystal lattices. The procedure used to obtain the energy spectra of the sputtered atoms, and results obtained by investigation of sputtered polycrystalline samples were reported in earlier papers (Izv. AN SSSR, ser. fiz. v. 28, 1387, 1964 and earlier papers). The present study, unlike the earlier one, is devoted to single crystals. The tungsten and molybdenum ions were sputtered by means of mercury ions using the set-up illustrated in Fig. 1 of the Enclosure. The results show that slow particles are better focused in the (111) direction, and fast particles in the (100) direction. With increasing energy of the primary ions, the flux of the particles in the (100) direction increases con-

pared with the flux in the (111) direction. The results are compared with those obtained by others and the various discrepancies are briefly discussed. "The authors thank O. D. Protopopov for supplying the single crystal samples." Orig. art. has: 5 figures and 2 formulas.

ASHNEVITS, I.Ya.

SUBJECT USSR/MATHEMATICS/Theory of functions CARD 1/2 PG - 541
 AUTHOR ASNEVIC I.Ja, ULINA G.V.
 TITLE On the range of values of analytic functions which can be
 represented as Stieltjes integral.
 PERIODICAL Vestnik Leningradsk. Univ. 10, No.11, 31-45 (1955)
 reviewed 1/1957

The authors consider the class $E = E[G(z,t);a,b]$ of functions $f(z)$, being regular in $|z| < 1$, having an integral representation of the form

$$f(z) = \int_a^b G(z,t) d\mu(t),$$

where $G(z,t)$ is regular in $|z| < 1$ for $a \leq t \leq b$, and where $\mu(t)$ is a monotone non-decreasing function such that $\int_a^b d\mu(t) = 1$. Various choices of the kernel $G(z,t)$ give well-known classes, e.g. $E_1 = E\left[\frac{e^{it}+z}{e^{it}-z}; -\pi, \pi\right]$ is the

class of functions having a positive real part in $|z| < 1$. It is shown first that the range of values of $f(z) \in E$ is a closed, connected, convex set which

Vestnik Leningradsk. Univ. 10, No.11, 31-45 (1955) CARD 2/2 PG - 541

is the convex hull of the curve $w = G(z, t)$, $a \leq t \leq b$. This appears to be the only theorem proved for the class E, for the authors confine themselves in the sequel to special kernels and deduce only those well-known properties of the corresponding classes; only those properties are deduced which follow immediately from a knowledge of the special kernels.

Title : Surface tension of thallium amalgam in a vacuum

Periodical : Dok. AN SSSR 101/2, 301-304, Mar 11, 1955

Abstract : The surface tension of thallium amalgam was investigated in accordance with the method of maximum pressure in the drop by means of a special gravitation instrument. The minimum observed on the isothermal curves representing the surface tension of the investigated thallium amalgam is explained, first by the relatively small difference in the surface tension of the amalgam component and secondly by the reaction between the amalgam components. An increase in temperature reduces the rate of reaction, and the minimum on the surface tension isotherms is equalized. Nine USSR references (1928-1953). Graphs.

Ed.: A. Murakayeva; Tech. Ed.: A. Salakhutdinova.

PURPOSE : This book is intended for builders, planners, and
engineering and technical personnel in the building-materials
industry.

COVERAGE: The book discusses certain characteristics of keramzit
[porous filler] products and the prefabrication of keramzit-
concrete products. Attention is also given to the use of
precast reinforced-concrete construction elements in seismic
regions and to methods of calculating monolithic joints.

TITLE: Effect of Beta-Radiation¹ on the Electric Conductivity of Synthetic
Ceresin¹
²¹

PERIODICAL: V sb.: Fiz. dielektrikov, Moscow, AS USSR, 1958, pp 50 - 51

ABSTRACT: The author studied the effect of β -radiation on the electric conductivity (σ) of synthetic ceresin. The ceresin was irradiated by a beam of β -particles from a preparation of radioactive P at room temperature; the measurement of σ was carried out at 100°C. After 45 hours of irradiation the σ of synthetic ceresin drops approximately by an order of magnitude (from 2.6×10^{-13} to $1.3 \times 10^{-14} \text{ ohm}^{-1} \text{ cm}^{-1}$). Such a diminution of σ , in the opinion of the authors, is explained by some irreversible processes, e.g. the cross-linking of molecular chains; this is confirmed by the change in the crystal-lattice parameter. (Politekhn. in-t, Novocherkassk, USSR).

TITLE: The Effect of β -Irradiation on Electric Conductivity and Structure of Synthetic Ceresin

PERIODICAL: "Tr. Novocherk. politekhn. in-ta", 1959, Vol. 73, "Raboty Kafedry fiz.", pp. 23-33

TEXT: The authors investigated the effect of β -irradiation (P^{32} isotope, energy 1.7 Mev, activity 5.6 mCi) on the structure and electric conductivity of synthetic ceresin which had, prior to irradiation, orthorhombic lattice at room temperature. With the growing irradiation dosage, interplanar spaces change according to a complicated law. Electric conductivity σ reduces considerably with the growth of irradiation dosage and does not restore completely to its initial value after discontinuation of irradiation effect. At the temperatures 70-100°C, the relation $\ln\sigma - 1/T$ is linear. At $T = 100^\circ\text{C}$ activation energy grows from 0.38 ev (for non-irradiated material) to 0.5 ev (after irradiation for 163

TITLE: Rare metals in the service of metallurgy and machine building

SOURCE: Tsvetnyye metally, no. 12, 1965, 90-91

TOPIC TAGS: rare earth metal, hardener, metallurgic research, metal property, metal analysis, machine industry

ABSTRACT: The proceedings of the All-Russian Conference-Seminar (on Rare Metals) are described. This conference was organized in Gor'kiy in March-April 1965 by the State Committee for the Coordination of Scientific Research under the Council of Ministers RSFSR in collaboration with the Volgo-Vyat'skiy Council of National Economy and the State Scientific Research and Design Institute of the Rare Metals Industry and was attended by 160 representatives of 60 organizations. At the conference 6 survey reports were presented on the economic effectiveness of the utilization of rare metals, the state and prospects of the production of rare metals, and the tasks of further research in this field. In addition, 37 papers on the results of scientific-research and pilot-industrial projects were presented. Essentially these papers showed that: at the Chelyabinsk Metallurgical Plant the addition of 0.15-0.25% rare-earth elements

(REM) enhances 2-2.5 times the plasticity of 3M2T and EI-481 high-alloy steels at 1100-1200°C. at the Zlatoust Metallurgical Plant the addition of REM to Kh20N80, Kh15N60 and OKh23N18 steel skelp increases the proportion of the defect-free tubes produced; the use of REM hardeners improves the plasticity and structure of 1Kh18N9T heat-resistant steel produced at several metallurgical plants. It was reported that the Voronezh Excavator Plant has built and dispatched to the Far North an experimental excavator in which 50 of the 85 tons it weighs are made of REM-containing steel. The conference also discussed studies of the successful tests of such alloy elements as Nb, B, Se, Te. It was also reported that, among other things, the Dnepropetrovsk Metallurgical Institute developed and introduced into industry the technology of the complex Ce-Mg inoculation of cast iron during the casting of rolling-mill rolls; the Belorussian Polytechnic Institute (O. S. Kumarov and D. N. Khudokormov) investigated the effect of more than 20 elements on the processes of the crystallization of cast iron and drew a number of important conclusions. In particular, it suggested that not only REM but also, e. g. Zr, and complex hardeners be used in the production of high-strength cast iron. The Giredmat and TsNIIChERMET reported on the status and prospects of the production of various hardeners: at present about 10 electrolytic hardeners are being produced and the experimental production of complex hardeners obtained by the furnace method has been organized; their composition may include nearly any rare metal plus Al, Si, Ca, etc. and preliminary findings indicate that, if mass-produced, "furnace" hardeners will be less expensive than electrolytic hardeners. Further, each ton of REM hardeners used produces savings of 12,000-15,000 rubles in the metallurgy of

Card 2/3

L 13287-66

ACC NR: AP6001110

steel and steel castings and 7,000-9,000 rubles in the production of iron castings. This has been confirmed by the operating experience of a number of plants. However, the widespread introduction of rare metals and primarily REM into industry is being hampered by a number of obstacles. Thus, the current volume and planned growth rate of the output of REM hardeners lag far behind the demand of metallurgy and machine building, and research into experimental hardeners is not conducted on an adequate scale. As a result, the cost of these hardeners is high. Similarly scientific research into the effect on the properties of metals of individual REM, Sr, Li, Sr, Te, Zr, Hf, Nb, Ga, Tl, Rb, Cs, Be is not performed on a sufficient scale, and uniform methods of the analysis of the residual content of rare metals in steel, iron, etc, are not being employed. The conference adopted a detailed resolution which, if implemented, will make it possible to improve the quality of metallurgical output, to improve and intensify technological processes, and to attain considerable savings by introducing rare metals.

Proceedings, Institute of Physics Conference, 22, 1955.

Principles of Dielectrics, by V. V. Vlasov, published by Naukova Dumka, (Physics of Dielectrics), Proceedings of the 2nd All-Union Conference on the Physics of Dielectrics, Moscow, October 1958, 532 pp. Errata slip inserted. 1000 copies printed.

Sponsoring Agency: Academy back 2000, Physicology Institute Acad. P.S. Letov, Ed. of Publishing House: Tel. Strelkovskaya, Tech. Ed., I. M. Dvornikov, Ed. Serial Board (Prop. Ed.), G.I. Savel'ev, Doctor of Physics and Mathematics, (Proceedings), and L.T. Filippova, Candidate of Physics and Mathematics.

Project: This collection of 1077 is intended for systematic investigating the Physics of dielectrics.

Concordat, 1st Soviet All-Union Conference on the Physics of Dielectrics held in Moscow at the Physics-Mathematics Institute P. S. Letov, (Physics Institute Acad. P.M. Lomonosov) in November 1958 was attended by representatives of the principal scientific centers of the USSR and of several other countries. This collection contains parts of the papers presented at the conference and summaries of the discussions which followed. The reports in this collection deal with dielectric properties, losses and dispersion, and with quantum mechanics aspects of various crystals, organic compounds, and ceramics. Photoelectrons, ferroelectric crystals and various radiation and irradiation effects on dielectrics are investigated. The volume contains a list of other papers presented at the conference dealing with polarization, losses, and breakdown of dielectrics, which were published in the journal "Pis'ma v ZH. SSSR" series "Diskussioni po fizike tverdogo stoychivosti". No personalities are mentioned.

Synthesis from anabasine. III. Condensation of aliphatic oxides with anabasine. A. Sadikov and N. A. Dzhabayeva. *J. Gen. Chem. (U.S.S.R.)* 17, 1212-15 (1947) (in Russian); cf. *C. A.* 40, 2150f. --Anabasine (81 g.) in 200 cc. MeOH allowed to stand 30 hrs. at 20° with 55 cc. ethylene oxide gave 43% *N*-*N*'-hydroxyethylanabasine, b.p. 174-8°, sol. in H₂O, CHCl₃, MeOH, EtOH; Me₂CO difficultly sol. in Et₂O or petr. ether; picrate m. 180-80.5° (from MeOH). Ambasidine (121 g.) in 200 cc. MeOH after standing 24 hrs. with 70 g. propylene oxide gave 15.5% *N*-*(2-hydroxypropyl)ambasidine*, b.p. 163-79°; a repetition of the prepn. in which 227 g. anabasine and 125 g. propylene oxide were mixed in 330 cc. MeOH with cooling to moderate the reaction and allowed to stand 36 hrs. gave 52% of purer product, b.p. 177-9°; *HCl* salt m. 168-70° (from EtOH-Et₂O); this on treatment with 40% NaOH and extn. with CHCl₃ gave the pure base, b.p. 178-9°, which crystd. on standing and m. 68-8°, sol. in alic. and CHCl₃, poorly sol. in H₂O and Et₂O; picrate m. 180-90° (from MeOH); *p*-phenylenediam. m. 10-11° (from Et₂O); 1 g. of the base with 2 g. alk. KMnO₄ gave anabasine, while 16 g. KMnO₄ per 3 g. of the base in 600 cc. H₂O at room temp., followed by boiling, gave nicotinic acid, m. 233-4°. G. M. Koselajoff

TITLE: Supersonic viscous flow over an external angle

SOURCE: AN SSSR. Izvestiya. Mekhanika, no. 4, 1965, 165-168

TOPIC TAGS: supersonic flow, boundary layer, Prandtl Meyer expansion, pressure distribution, wind tunnel, experimental method

ABSTRACT: Experimental and analytical studies were conducted to determine the flow of a supersonic air stream over an expansion corner (see Fig. 1 on the Enclosure) with expansion angles $\alpha = 5^\circ$, 10° , and 15° . The model used was a thin wedge 90 mm wide at Mach numbers of 2.42 and 2.63 and $Re = 8.3 \times 10^6$. The boundary layer over the wedge surface was assumed to be turbulent. Calculated results and the experimental data of the pressure ratio along the wedge surface and over the corner are shown in Fig. 2 on the Enclosure. It can be seen that for all these values of α ($1 = 5^\circ$, $2 = 10^\circ$, $3 = 15^\circ$) the pressure ratio first shows a rise at the corner, followed by a gradual decrease to their asymptotic values. Furthermore, the agreement between theory and experiment is satisfactory. Reasonably good agreement was also obtained for a plot of L/δ^* versus expansion angle (δ^* - displacement thickness).

at corner). To determine the boundary layer characteristics after the expansion,
the experimental data were correlated by the empirical expression

$$\lg \lambda^+ = f(\lg u) \quad (\lambda = u/u^*)$$
